RE: Schedule for Atlantic Herring Benchmark Stock Assessment

Dear Nancy:

As you are aware, the Northeast Region Coordinating Committee (NRCC) was not able to satisfy the New England Fishery Management Council's request for a benchmark stock assessment for the Atlantic herring stock complex during 2010 and instead scheduled an assessment for June 2012 (SARC 54). However, the timing for the next assessment is not practical and may cause management problems. The results of the upcoming benchmark assessment will form the basis of scientific and management decisions for the 2013-2015 Atlantic herring fishery specifications, which must be developed during 2012. Adequate time should be budgeted for the Council to make informed decisions based on the best available scientific information. I am therefore writing to request that the Science Center reschedule the next benchmark stock assessment for Atlantic herring from SARC 54 (June 2012) to SARC 53 (December 2011).

The Council's new process for establishing annual catch limits (ACLs) requires at least six months to review new scientific information, work with the Science and Statistical Committee (SSC) to determine acceptable biological catch (ABC) levels, consider management uncertainty and analyze options for ACLs, and select the final ACLs/sub-ACLs for the herring management areas. The Atlantic herring fishing year begins on January 1, so the 2013-2015 fishery specifications should be submitted to NMFS by October 2012 if possible. A benchmark stock assessment in June 2012 does not leave adequate time for the process to develop the 2013-2015 fishery specifications.

The Council faced a similar situation in 2009 when the updated assessment results from the Transboundary Resource Assessment Committee (TRAC) were released in July 2009. As a result of the assessment timing, developing the 2010-2012 herring fishery specifications became more difficult under an abbreviated and rushed meeting/work schedule. Final decisions were made by the Council in November 2009, and the specifications were submitted in late December 2009 and will not be implemented until sometime during the 2010 fishing year. This process created confusion and uncertainty, imposed significant burdens on the analysts and staff

members involved, and may generate additional problems if any quotas are reached/exceeded before the specifications are implemented.

There is an opportunity now to avoid this situation for the 2013-2015 herring specifications if the assessment can be rescheduled such that the Council has adequate time to consider the assessment results and incorporate the new science into the decision-making process. A benchmark stock assessment for Atlantic herring will presumably produce a substantial amount of new scientific information, which needs to be fully reviewed by the Herring Plan Development Team (PDT), the SSC, and the Council so that sound and informed decisions can be made regarding scientific uncertainty, management uncertainty, and ACLs for the herring fishery. A December 2011 benchmark assessment (SARC 53) would give the Council and NMFS adequate time to ensure that the best available information forms the basis of the 2013-2015 specifications, and that the specifications can be developed, submitted, and implemented in a timely manner.

Thank you for your consideration of this request. Please feel free to contact me if you have any additional questions.

Sincerely,

Paul J. Howard
Executive Director

Dear Capt. Howard:

Subject: Schedule for Atlantic Herring Benchmark Stock Assessment

Thank you for your letter of January 5, 2010, requesting that the Science Center reschedule the next benchmark stock assessment for Atlantic herring from SARC 54 (June 2012) to SARC 53 (December 2011). This change can be accommodated in the SARC schedule, but it will require some details to be considered before the NRCC makes this change official. First, given that the assessment will be held six months earlier, there will be less time to work on the assessment, less data available, and the Terms of Reference will have to be adjusted. This is explained more fully in the enclosed table. Second, adding herring to SARC 53 will mean that either a benchmark assessment (black sea bass or GOM cod) or the review of signposts will need to be deferred to a subsequent SARC. Our staffs will need to work out these details for consideration by the NRCC.

We have consulted with NERO and they support your request to change the herring assessment to SARC 53.

Sincerely,

Nancy B. Thompson, Ph.D.
Science and Research Director
