Framework Adjustment XX  
To the Northeast Multispecies FMP  
Draft Management Measures

*These measures are under development and will be modified  
June 11, 2012*

Prepared by the  
New England Fishery Management Council  
In consultation with the  
Mid-Atlantic Fishery Management Council  
National Marine Fisheries Service

Initial Framework Meeting:  
Final Framework Meeting:  
Date Submitted:

6.4.2.1	Atlantic Sturgeon.....	106

## 4.0 Alternatives Under Consideration

### 4.1 *Updates to Status Determination Criteria, Formal Rebuilding Programs and Annual Catch Limits*

#### 4.1.1 Revised Status Determination Criteria for GOM cod, GB cod, SNE/MA yellowtail flounder, and White Hake

##### 4.1.1.1 Option 1: No Action

If no action is adopted, there will be no revisions to status determination criteria for the Georges Bank and Gulf of Maine cod stocks, the Southern New England/Mid-Atlantic yellowtail flounder stock, or white hake. Please note that this option could be selected for all of these stocks, or only some of these stocks. The following criteria would apply:

**Table 1 – No Action status determination criteria**

Stock	Biomass Target (SSB <sub>MSY</sub> or proxy)	Minimum Biomass Threshold	Maximum Fishing Mortality Threshold (F <sub>MSY</sub> or proxy)
Gulf of Maine Cod	SSB <sub>MSY</sub> : SSB/R (40% MSP)	½ Btarget	F40%MSP
Georges Bank Cod	SSB <sub>MSY</sub> : SSB/R (40% MSP)	½ Btarget	F40%MSP
SNE/MA Yellowtail Flounder	SSB <sub>MSY</sub> : SSB/R (40% MSP)	½ Btarget	F40%MSP
White Hake	SSB <sub>MSY</sub> : SSB/R (40% MSP)	½ Btarget	F40%MSP

**Table 2 – No action numerical estimates of SDCs**

Stock	Model	Bmsy or proxy (mt)	F <sub>MSY</sub> or proxy	MSY (mt)
Gulf of Maine Cod	ASAP	61,218	0.20	10,392
Georges Bank Cod	VPA	148,084	0.25	31,159
SNE/MA Yellowtail Flounder	VPA	27,400	0.25	6,100
White Hake	SCAA	56,254	0.13	5,800

##### 4.1.1.2 Option 2: Revised Status Determination Criteria for GOM cod, GB cod, SNE/MA yellowtail flounder, and White Hake

The M-S Act requires that every fishery management plan specify “objective and measurable criteria for identifying when the fishery to which the plan applies is overfished.” Guidance on this requirement identifies two elements that must be specified: a maximum fishing mortality

threshold (or reasonable proxy) and a minimum stock size threshold. The M-S Act also requires that FMPs specify the maximum sustainable yield and optimum yield for the fishery. Amendment 16 adopted status determination criteria for regulated groundfish stocks as determined by the GARM III (NEFSC 2008). Framework 45 updated status determination criteria for Atlantic pollock to reflect the results of an additional assessment conducted in 2010.

The NEFSC conducted new assessment for the GOM cod, GB cod, and SNE/MA yellowtail flounder stock in 2012. An assessment for white hake will be conducted in 2013. This action adopts the revised status determination criteria for these stocks. The review panel recommended the criteria and numerical values in Table 3 and Table 4.

This option considers a range of values since the assessments will not be completed until after the Council vote on this action

**Table 3 – Option 2**

Stock	Biomass Target ( $SSB_{MSY}$ or proxy)	Minimum Biomass Threshold	Maximum Fishing Mortality Threshold ( $F_{MSY}$ or proxy)
Gulf of Maine Cod	$SSB_{MSY}$ or a proxy for $SSB_{MSY}$	$\frac{1}{2}$ Btarget	$F_{MSY}$ or a proxy for $F_{MSY}$
Georges Bank Cod	$SSB_{MSY}$ or a proxy for $SSB_{MSY}$	$\frac{1}{2}$ Btarget	$F_{MSY}$ or a proxy for $F_{MSY}$
SNE/MA Yellowtail Flounder	$SSB_{MSY}$ : $SSB/R$ (40% MSP)	$\frac{1}{2}$ Btarget	$F_{40\%MSP}$
White Hake	$SSB_{MSY}$ or a proxy for $SSB_{MSY}$	$\frac{1}{2}$ Btarget	$F_{MSY}$ or a proxy for $F_{MSY}$

**Table 4 – Option**

Stock	Model	Bmsy or proxy (mt)	$F_{MSY}$ or proxy	MSY (mt)
Gulf of Maine Cod	ASAP			
Georges Bank Cod	VPA			
SNE/MA Yellowtail Flounder	ASAP			
White Hake	SCAA			

*Rationale:*

#### 4.1.2 SNE/MA Windowpane Flounder Sub-ACLs

More than one alternative to No Action/Option 1 can be adopted from this section.

##### 4.1.2.1 Option 1: No Action

If this option is adopted, there will not be any additional sub-ACLs adopted for SNE/MA windowpane flounder. Only the multispecies fishery will have a sub-ACL for this stock and the AMs for the multispecies fishery must be sufficient to account for overages of the overall ACL.

#### 4.1.2.2 Option 2: Scallop Fishery SNE/MA Windowpane Flounder Sub-ACL

If this option is adopted, a sub-ACL of SNE/MA windowpane flounder will be allocated to the scallop fishery. The sub-ACL will be based the 90<sup>th</sup> percentile of the scallop fishery catches (as a percent of the total) for the period calendar year 2001 through 2010. This value is (*approximately 32 pct – need to investigate trawl fishery catches of this stock*).

The Scallop FMP will develop AMs for this sub-ACL.

#### 4.1.3 Scallop Fishery Sub-ACL for Georges Bank GB Yellowtail Flounder

##### 4.1.3.1 Option 1: No Action

If this option is adopted, there will not be any changes to how the scallop fishery sub-ACL for GB yellowtail flounder is determined. The amount will be determined when groundfish specifications are set and will consider such information as is available and appropriate.

##### 4.1.3.2 Option 2: Scallop Fishery Sub-ACL for GB Yellowtail Flounder Specified as 90 percent of the Estimated Catch

If this option is adopted, on an annual basis, the Scallop and Groundfish Plan Development Teams will estimate the amount of GB yellowtail flounder that the scallop fishery is expected to catch in the following year while harvesting the available scallop yield. This estimate will be provided to the Council at the September Council meeting. The allocation of GB yellowtail flounder to the scallop fishery will be changed to 90 percent of this amount through a notice action without the need for a Council vote. Should the Council wish to revise this allocation, a change must be adopted through a specification change or other management action.

##### 4.1.3.3 Option 3: Scallop Fishery Sub-ACL for GB Yellowtail Flounder Specified Based on Catch History

If this option is adopted, the scallop fishery sub-ACL for GB yellowtail flounder will be specified as a percentage of the U.S. ABC based on recent catch history. There are two sub-options under consideration:

Sub-option A: The percentage would be XX percent, based on the scallop fishery catches of mthis stock as a percentage of total U.S. Catches for the five calendar year period 2007-2011.

Sub-option B: The percentage would be XX percent, based on the scallop fishery catches of mthis stock as a percentage of total U.S. Catches for the ten calendar year period 2002-2011.

#### 4.1.4 U.S./Canada Resource Sharing Understanding TACs

##### 4.1.4.1 Option 1: No Action

If no action is taken on specifications, the recommendations of the TMGC would not be implemented and there would be no TAC for EGB cod, haddock, or GB yellowtail flounder in the U.S./Canada area for FY 2013. Vessels would still be constrained by the other regulations of the FMP, including days-at-sea (DAS), sector regulations, and closed areas.

##### 4.1.4.2 Option 2: U.S./Canada TACs - TBD

This alternative would specify TACs for the U.S./Canada Management Area for FY 2013 as indicated in Table 5 below. These TACs would be in effect for the entire fishing year, unless NMFS determines that FY 2012 catch of GB cod, haddock, or yellowtail flounder from the U.S./Canada Management Area exceeded the pertinent 2012 TAC. If the TAC in a particular fishing year is exceeded, the Understanding and the regulations require that the TAC for the subsequent fishing year is reduced by the amount of the overage. In order to minimize any disruption to the fishing industry, NMFS would attempt to make any necessary TAC adjustment in the first quarter of the fishing year.

Table 5 - Proposed FY 2012 U.S./Canada TACs (mt) and Percentage Shares

TAC	Eastern GB Cod	Eastern GB Haddock	GB Yellowtail Flounder
Total Shared TAC			
U.S. TAC			
Canada TAC			

A comparison of the proposed FY 2012 U.S. TACs and the FY 2011 U.S. TACs is shown in Table 6. Changes to the U.S. TACs reflect changes to the percentage shares, stock status, and the TMGC recommendations.

**Table 6 - Comparison of the Proposed FY 2012 U.S. TACs and the FY 2011 U.S. TACs (mt)**

Stock	U.S. TAC		Percent Change
	FY 2012	FY 2011	
Eastern GB cod			
Eastern GB haddock			
GB yellowtail			

*Rationale:* The U.S. and Canada coordinate management of three stocks that overlap the boundary between the two countries on Georges Bank. Agreement on the amount to be caught is reached each year by the Transboundary Management Guidance Committee (TMGC). This measure would adopt the recommendations of the TMGC. It makes sure that catches are consistent with the most recent assessments of those stocks.

#### 4.1.1 Annual Catch Limit Specifications

##### 4.1.1.1 Option 1: No Action

If the No Action option is selected, the specifications for FY 2013-FY 2014 would remain as adopted by FW 47. For many stocks there would not be any specifications for these years. The FY 2013- Fy 2014 ABCs would be as specified in **Error! Reference source not found.**

Alternatives Under Consideration  
 Updates to Status Determination Criteria, Formal Rebuilding Programs and Annual Catch Limits

**Table 7 – No Action/Option 1 Northeast Multispecies OFLs, ABCs, ACLs, and other ACL sub-components for FY 2012 (metric tons, live weight). Values are rounded to the nearest metric ton.**

(1) Grayed out values may be adjusted as a result of future recommendations of the TMGC. Values shown for GB haddock and cod are preliminary estimates subject to change.

## **4.2 Commercial and Rrecreational Fishery Measures**

### 4.2.1 Management Measures for the Recreational Fishery

This section considers changing recreational fishery management measures as necessary to control catches of GO Mcod and GOM haddock.

#### 4.2.1.1 Option 1: No Action

TBD

#### 4.2.1.2 Option 2: Revised Measures

TBD

### 4.2.2 Groundfish Monitoring Program Revisions

#### 4.2.2.1 Option 1: No Action

TBD

#### 4.2.2.2 Option 2: Monitoring Program Goals and Objectives

The goals of the groundfish monitoring program are as follows:

##### **Goal 1: Improve documentation of catch**

Objectives:

- Determine total catch and effort, for each sector and common pool, of target or regulated species
- ~~Determine catch by area to ensure accurate catch accounting while maintaining as much flexibility as possible to enhance fleet viability (Deleted by-Council motion April 2012)~~
- Achieve coverage level sufficient to minimize effects of potential monitoring bias while maintaining as much flexibility as possible to enhance fleet viability (Added by-Council motion April 2012)

##### **Goal 2: Reduce cost of monitoring**

Objectives:

- Streamline data management and eliminate redundancy
- Explore options for cost-sharing and deferment of cost to industry
- Recognize opportunity costs of insufficient monitoring

**Goal 3: Incentivize reducing discards**

Objectives:

- Determine discard rate by smallest possible strata while maintaining cost-effectiveness
- Collect information by gear type to accurately calculate discard rates

**Goal 4: Provide additional data streams for stock assessments**

Objectives:

- Reduce management and/or biological uncertainty
- Perform biological sampling if it may be used to enhance accuracy of mortality or recruitment calculations

**Goal 5: Enhance safety of monitoring program**

**Goal 6: Perform periodic review of monitoring program for effectiveness**

4.2.2.3 Option 3: ASM Coverage Levels

*Tentative measure – TBD*

4.2.2.4 Option 4: Industry At- Sea Monitoring Cost Responsibility

If adopted, this option would make the following distinctions between those aspects of the Groundfish monitoring program which the fishing industry could be required to support (partially or entirely) and those programmatic costs that will continue to be funded (permanently and entirely) by the National Marine Fisheries Service. Specifically, the industry shall only ever be responsible for contributing to the funding for direct at-sea monitor (ASM) costs: specifically the daily salary of the at-sea monitor.

Costs of the ASM and monitoring program shall continue to be supported entirely by NMFS. These program elements and activities would include, but are not exclusive to:

- Briefing, debriefing, training and certification costs (salary and non-salary)
- Sampling design development
- Data storage, management and security
- Data quality assurance and control
- Administrative costs
- Maintenance of monitoring equipment
- ASM recruitment, benefits, insurance and taxes
- Logistical costs associated with ASM deployment
- ASM travel and lodging

4.2.2.5 Option 5: At –Sea Monitoring Funding Mechanisms

If this option is adopted, each sector (including the common pool) that incurs monitoring costs will be provided ACE to help defray the costs of sector monitoring programs (i.e. lease only sectors and state permit banks will not be provided additional ACE to defray monitoring costs). The program will target providing sufficient ACE to cover 100 percent of the direct costs of monitoring as defined in section 4.2.2.4. The additional ACE will be provided from one of two sources:

- Sub-Option A: A percentage of the sub-ACL for commercial groundfish vessels
- Sub-Option B: A percentage of the difference between the ACL and the ABC for commercial groundfish vessels.

{Need to specify how percentage is determined}

Once the amount of each stock available is determined, it will be distributed to the sectors and common pool in one of the following ways.

Sub Option C: The additional monitoring ACE will be distributed in proportion to each group's ACE. As an example, if a sector received 5 percent of the overall ACE for stock A, it will receive 5 percent of the amount available to defray monitoring costs.

Sub-Option D: The additional monitoring ACE will be distributed in proportion to the distribution of monitoring costs in the previous fishing year. As an example, if a sector incurred 5 percent of the total monitoring costs in the previous fishing year, the sector would receive 5 percent of the amount available to defray monitoring costs.

Sub-Option E: The monitoring cost per pound caught in the previous fishing year will be calculated for each sector (including the common pool). The sectors will be ranked in order of cost per pound with the lowest ranked sector at 1. Each sector (or the common pool) will receive a share for the available ACE calculated as:

$$\text{Share} = \text{Sector Rank} / (\text{Sum of all ranks})$$

Sub-Option F: TBD. An option designed to incentivize reducing discard; TBD.

The ACE provided by the sectors will be leased to defray the monitoring costs of the sector. The ACE can be leased within the sector, or can be leased to another sector. Each sector can determine lease prices in any manner chosen by the sector.

In the sector's annual report, a full accounting will be made of all leases of the funding ACE. This report will include the amounts (pounds) of each stock leased, the revenues obtained from that lease, whether the lease was internal or external to the sector, and if an external lease the receiving sector will be identified.

#### 4.2.2.6 Dockside Monitoring Requirements

##### 4.2.2.6.1 Option 1: No Action

TBD

#### 4.2.2.6.2 Option 2: Elimination of Dockside Monitoring Requirement

If adopted, this option would elimainte all dockside monitoring requirements beginning in FY 2013.

### 4.2.3 Commercial Fishery Minimum Size Restrictions

#### 4.2.3.1 Option 1: No Action

If no action is adopted, there will be no revision to the regulations regarding landings of the allocated regulated groundfish currently managed. The following minimum fish size regulations would apply unless changed in this or a future action.

Table 1 – No Action Minimum Fish Sizes (TL) for Commercial Vessels

<b>Species</b>	<b>Size (inches)</b>
Cod	22 (55.9 cm)
Haddock	18 (45.7 cm)
Pollock	19 (48.3 cm)
Witch Flounder (gray sole)	14 (35.6 cm)
Yellowtail Flounder	13 (33.0 cm)
American Plaice (dab)	14 (35.6 cm)
Atlantic Halibut	41 (104.1 cm)
Winter Flounder (blackback)	12 (30.5 cm)
Redfish	9 (22.9 cm)

#### 4.2.3.2 Option 2: Full Retention

If this action is adopted all allocated currently regulated groundfish of all sizes, including cod, haddock, white hake, pollock, Acadian redfish, yellowtail flounder, Georges Bank and Gulf of Maine winter flounder, witch flounder, and American plaice, must be retained by sector vessels, i.e. no discarding of non-prohibited fish. Discarding of non-allocated groundfish species, including those that require no-retention as part of a rebuilding program, and those regulated under other Fishery Management Plans, will continue. Allocated regulated groundfish that are physically damaged, e.g. by predation, must be retained. This action would not alter regulated mesh areas or restrictions on gear and methods of fishing.

*Rationale:* Full retention may help reduce monitoring costs by facilitating the adoption of electronic monitoring, as there would be less of a need to estimate the weight of groundfish discards. The amount of data collected by at-sea monitors required for total discard estimation and composition would also be reduced. Discarding is considered to be a wasteful practice. A

portion of discarded fish is thrown back dead resulting in economic loss to fishermen and the needless loss of fish to the population.

#### 4.2.4 Commercial Fishery Accountability Measures

##### 4.2.4.1 Option 1: No Action

*TBD*

##### 4.2.4.2 Option 2: Change to AM Timing for Ocean Pout and Windowpane Flounder Stocks

If adopted, should reliable information be available that an ACL has been exceeded during a fishing year, the respective AM for that stock would be implemented at the start of the next fishing year. AMs would not be implemented in the middle of a fishing year.

##### 4.2.4.3 Option 3: Area – Based Acountability Measures for Atlantic Halibut, Atlantic Wolffish, and SNE/MA Winter Flounder

###### **Atlantic halibut**

The groundfish fishery AM for Atlantic halibut would be implemented if the total ACL (as opposed to the groundfish sub-ACL) is projected to be exceeded. Should a sub-ACL be allocated to other fisheries and AMs developed for those fisheries, the AMs for either (or both) fisheries will be implemented only if the total ACL for the stock is exceeded. If only one fishery exceeds its sub-ACL the AM will be implemented only for that fishery. Note that for this stock a specific area-based measure becomes effective only if catches exceed the ACL by more than the allowance for management uncertainty. In effect, the area-based measures are effective if the ABC is exceeded.

If the AM is implemented trawl vessels would be required to use approved selective trawl gear that reduces the catch of flounders and retention of Atlantic halibut would be prohibited. Approved gears include the separator trawl, Ruhle trawl, mini-Ruhle trawl, rope trawl, and other gear authorized by the Council in a management action or approved for use consistent with the process defined in 50 CFR 648.85 (b)(6).

If the AM is implemented, sink gillnet and longline vessels would not be allowed to fish in the AM areas described below. Should selective gear be developed that reduces catches of these species then fishing would be allowed in these areas as long as the gear is used. Such gear must be approved through the process used to authorize selective trawl gear before it is authorized for use.

**Areas:** The areas are designed to account for an ACL overage of up to 20 percent. The areas would be implemented for ACL overages that exceed the management uncertainty buffer. Should an overage exceed 20 percent of the ACL, then this measure will be redesigned in a future action.

The applicable areas where trawl gear restrictions would apply are shown in **Error! Reference source not found.**

The areas where sink gillnet and longline fishing would be prohibited (or if selective gear is developed, where use of the gear would be required) are also shown in **Error! Reference source not found.**

43-10N 69-30W  
43-00N 69-30W  
43-00N 69-40W

**Figure 1 – Proposed AM areas for fixed gear and trawl vessels for halibut.**

### **Atlantic Wolffish**

The groundfish fishery AM for Atlantic wolffish would be implemented if the total ACL (as opposed to the groundfish sub-ACL) is projected to be exceeded. Should a sub-ACL be allocated to other fisheries and AMs developed for those fisheries, the AMs for either (or both) fisheries will be implemented only if the total ACL for the stock is exceeded. If only one fishery exceeds its sub-ACL the AM will be implemented only for that fishery. Note that for this stock a specific area-based measure becomes effective only if catches exceed the ACL by more than the allowance for management uncertainty. In effect, the area-based measures are effective if the ABC is exceeded.

If the AM is implemented trawl vessels would be required to use approved selective trawl gear that reduces the catch of demersal species. Approved gears include the separator trawl, Ruhle trawl, mini-Ruhle trawl, rope trawl, and other gear authorized by the Council in a management action or approved for use consistent with the process defined in 50 CFR 648.85 (b)(6).

If the AM is implemented, sink gillnet and longline vessels would not be allowed to fish in the AM areas described below. Should selective gear be developed that reduces catches of these species then fishing would be allowed in these areas as long as the gear is used. Such gear must

be approved through the process used to authorize selective trawl gear before it is authorized for use.

The AM measures would be in effect from May through December, and in April. The measures would not be in effect from January through March because the habits of wolffish make it less susceptible to fishing at that time.

**Areas:** The areas are designed to account for an AM overage of up to 20 percent. The areas would be implemented for ACL overages that exceed the management uncertainty buffer. Should an overage exceed 20 percent of the ACL, then this measure will be redesigned in a future action.

The applicable areas where trawl gear restrictions would apply are shown in **Error! Reference source not found..**

The areas where sink gillnet and longline fishing would be prohibited (or if selective gear is developed, where use of the gear would be required) are shown in **Error! Reference source not found..**

**Figure 2 – Proposed AM areas for fixed gear and trawl gear for wolffish. Note the AM areas overlap on the western side of the WWGOM closed area.**

### **SNE/MA Winter Flounder**

The groundfish fishery AM for SNE/MA winter flounder would be implemented if the total ACL (as opposed to the groundfish sub-ACL) is projected to be exceeded. Should a sub-ACL be allocated to other fisheries and AMs developed for those fisheries, the AMs for either (or both) fisheries will be implemented only if the total ACL for the stock is exceeded. If only one fishery exceeds its sub-ACL the AM will be implemented only for that fishery. Note that for both stocks, a specific area-based measure becomes effective only if catches exceed the ACL by more than the allowance for management uncertainty. In effect, the area-based measures are effective if the ABC is exceeded.

If the AM is implemented trawl vessels would be required to use approved selective trawl gear that reduces the catch of demersal species. Approved gears include the separator trawl, Ruhle trawl, mini-Ruhle trawl, rope trawl, and other gear authorized by the Council in a management action or approved for use consistent with the process defined in 50 CFR 648.85 (b)(6). There would be no restrictions on longline or gillnet gear.

**Areas:** The applicable areas where gear restrictions would apply are shown in Figure 3. The areas are designed to account for an AM overage of up to 20 percent. The areas would be implemented for ACL overages that exceed the management uncertainty buffer. Should an overage exceed 20 percent of the ACL, then this measure will be redesigned in a future action.
